

Installation Instructions for Moto-Skills 3d Printed Beta Numberplate

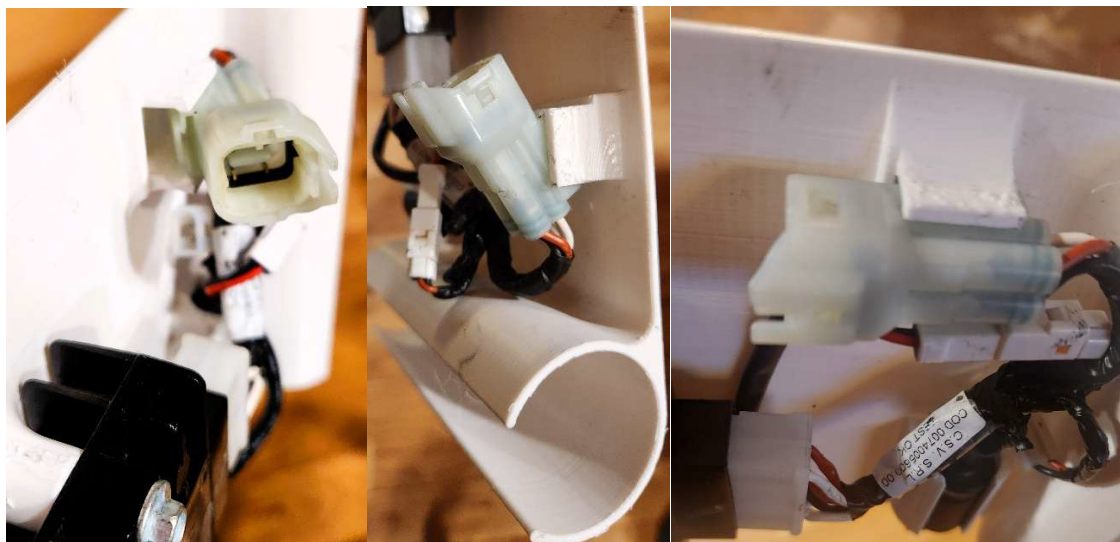

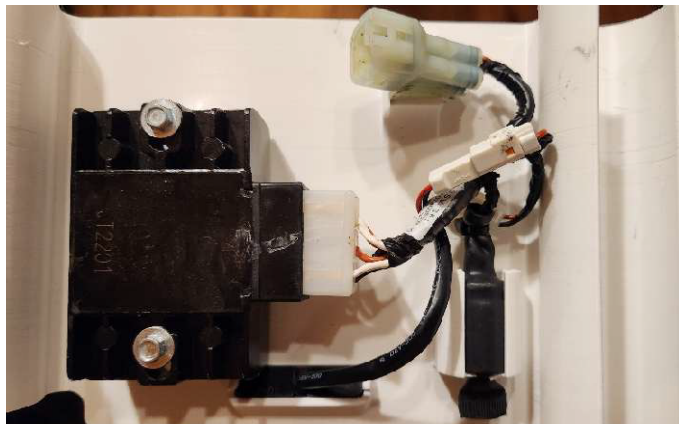

Installation instructions and notes.

The headlight installs by sliding it into the opening from the back of the plate. The clips on the short edges sometimes need a little trimming.

Looking at the back of the plate, there are 2 round towers for the voltage regulator to be screwed to using the factory screws. Orient the regulator so the fins are closer to the plate and the electrical connector faces the center.

The round cavity in the lower right corner is to hold the capacitor securely and protects it from damage. It slides in from the top with the wires facing the plug clip.

The Plug clip is the hardest part of the install. The orientation is important. The rectangular part of the connector goes down into the clip. The release tab should be opposite of the number plate face. See images below for clarification.
